

Specific	The specific goal of this project is to create a software solution for drone pilots to help them navigate the airspace with dynamic data from nearby manned aircraft.
Measurable	Running tests with mockup data and real stored data to ensure that the software solution is working correctly. Further, it needs to be tested in a real-life environment in collaboration with drone pilots.
Attainable	The project itself is achievable and within my capabilities and having supervisors that are experts within the drone field and software engineering to ask for help and guide me if I have any doubts.
Relevant	The relevance of this project is high since it can reduce the need for two pilots to operate a drone to one which will help with operational cost and free up resources.
Time-bound	The project starts the 1st of February and ends the 1st of June
